Description of sources and methods
used to compile annual non-financial accounts by institutional sector in Lithuania
(Annual sector accounts inventory)

Situation as of: December 2015

This is a description of the sources and methods used to compile annual non-financial accounts by institutional sector in Lithuania. This inventory is based on ESA2010.

A General overview

1. Organisational aspects

1.1. Description of the organisation and responsibilities for the compilation of non-financial Annual Sector Account and related datasets

Annual non-financial Sector Accounts (ASA) is compiled by Statistics Lithuania. There is no single Annual sector accounts unit in Statistics Lithuania. ASA data are compiled by National Account division and Government Finance Statistics (GFS) division. The National accounts division is most heavily involved in the compilation of annual sector accounts. Furthermore the GFS division plays an important role in the processing and analysis of source data for the subsectors of General government.

The National accounts division counts 23 employees in 2015. Eighteen chief specialists are responsible for the estimation of NA components by one institutional sector or compilation of group macro-aggregates by all institutional sectors in one account. Other two senior specialists assist them in estimation of smaller parts of NA. The responsibility between staff members are distributed according to the general topics of the System of National Accounts (annual and quarterly macro aggregates, sectoral accounts, SUT and IOT, Regional accounts and EU Own resources statistics related to VAT). Every employee is in charge of the specific economic area or group of macro-economic indicators.

GFS division of Statistics Lithuania was established starting from 3rd of December 2012. GFS division is responsible for the compilation of GFS data: EDP data, annual and quarterly data of non-financial and financial accounts for General government. There are 8 employees working in this division. They are also occupied by some arrangements related to data sources for government units: processing of public institutions accounts (e.g. for public hospitals), checking and analysis of data sources, publishing of GFS data.

Although there is no separate working group for ASA matters as such, methodological issues are discussed between compilers of National accounts and GFS in the Inter-institutional group of Experts in Macroeconomic Statistics. They work in the close cooperation on a daily basis. The Inter-institutional group of Experts in Macroeconomic Statistics chaired by Statistics Lithuania comprise representatives for Statistics Lithuania, Ministry of Finance (MoF), The Bank of Lithuania (BoL), the Ministry of Economy and some others.

Sectorisation questions are discussed within Inter-institutional Working Group on Sectorisation, chaired by the deputy head of the National Accounts Division of NSI.

1.2. Organisation chart

A total of 9 persons contribute to the production of annual non-financial sector accounts. The staff allocation in person-years is difficult to estimate because all compilers have duties in other areas like main aggregates, quarterly and annual national accounts and sector accounts, government finance including the EDP, financial accounts and in various development projects.
ASA compiling divisions

National accounts division (NA)

Head of NAD

2 deputy heads

- Production of main aggregates for NFC and HH sectors – 3 persons,
- Production of main aggregates for FC sector, including FISIM – 1 person,
- Generation of income for all institutional sectors – 1 person,
- GDP expenditure components, weights for PPP – 1 person,
- Expenditure of HH and NPISH sectors – 1 person,
- ROW sector accounts – 1 person.
- Institutional sector accounts and Regional accounts – 1 person
- Input – Output Tables, Supply – Use Tables – 2 persons
- Price and volume indices – 1 person
- Employment – 1 person
- Capital flows and stocks:
  a) GFCF – 3 persons,
  b) Changes in inventories – 1 person,
  c) Capital stocks, CFC – 1 person.
- Data dissemination, publications, IT issues, SDMX, GESMES – 2

Government finance statistics division (GFS)

Head of GFSD

- EDP and related statistics – 1 person,
- Annual and quarterly GG revenue and expenditure – 2 persons,
- Annual financial accounts – 1 person
- Quarterly financial accounts for GG, pension entitlements – 1 person
- Tax statistics – 1 person
- Statistics on public institutions included into GG – 1 person

2. ASA compilation overview

For the compilation of annual sector accounts a large number of sources and compilation methods are used. In this paragraph only a very rough overview will be presented. However, a detailed description of sources used and methods by sector and transaction can be found in section C and D.

2.1. Data Sources

The Annual sector accounts compilation relies on a variety of data sources. Statistical information sources are statistical surveys of businesses and households, including administrative data sources – the Ministry of Finance, the Bank of Lithuania, the State Social Insurance Fund, Centre of Registers, State Tax Inspectorate, the department of Customs – and other sources.

For the sector S11 non-financial corporations the main data source is the Structural Business Survey (SBS). Production-related variables are based upon this source. The data sources of SBS: the statistical questionnaire on enterprise economic activity (F-01 annual “Main financial indicators of an enterprise”) of public and private companies, state-owned and municipal enterprises, foreign affiliates, agricultural and cooperative partnerships, public bodies, annual financial statements of enterprises. The results of the annual survey are supplemented by the information obtained from financial statements (balance sheets), which are collected by Tax Authorities (Tax Inspectorate). This information is used for checking whether a non-respondent enterprise was active or not. If yes, data from financial statements are taken into the calculations of the particular enterprise. Mathematical methods are applied for calculating missing data in the tax files. Furthermore counterpart information is often used as information source.

The main sources of the primary data for the sector S.12 - Financial corporations are the financial statements of central bank, commercial banks, insurance companies, pension funds, investment management and financial brokerage companies provided by the BoL. BoL is responsible for monetary and banking statistics and compiles the Balance of Payments data. For other financial intermediaries these data are obtained from the comprehensive surveys carried out by Statistics Lithuania.

MoF provides information on government revenues and expenditures of central and local governments for the sector S.13 – General government. In order to meet ESA2010 requirements, supplementary data could be used for e.g. for accrual adjustments, reclassification of specific transactions. In addition, reports on the Social Security Fund, the Compulsory Health Insurance Fund, Employment Fund and other extra-budgetary funds are provided directly to the Statistics Lithuania by the institutions involved. State Social Insurance Fund, Compulsory Health Insurance Fund accounts are on accrual basis. Quarterly statistical survey for public hospitals is used. Financial statements and statistical survey are used for public enterprises (Deposit and Investment Insurance, Lithuanian National Radio and Television, Property Bank, State Property Fund, Lithuanian Oil Products Agency, Agriculture Information and Rural Business Center, Vilnius City Housing).

The data for the household sector S.14 are available from SBS through Tax Inspectorate, which is the provider of the information for the basic calculations of Household sector. Statistics Lithuania
has access to the information on tax declarations of individual enterprises and information on income tax declarations of natural persons carrying out economic activity. SBS is dealing with information obtained and then providing it to NA. National Accounts are getting the information from SBS in aggregated form: data are distributed by activities at the same NACE level, as the data of non-financial enterprises are presented.

The main source for the sector of non-profit institutions serving households S.15 is the annual survey of non-profit institutions conducted by Social protection and Health statistics Division of Statistics Lithuania. Non-profit institutions are reporting the number of members, number of employees, their means, income, sales, costs, etc.

Sector S2 rest of the world is well covered by direct annual sources. The balance of payments can be considered as the most important source. In addition some indirect sources are used such as taxation charts of the Ministry of Finance. Finally in some cases other information including counterpart information is used.

2.2. Methods

ASA are composed on a regular basis since the 1995. Data are composed for six main sectors: non-financial corporations, financial corporations, government, households, NPISH and the rest of the world. For each of them integrated data are composed for about 60 current and capital transactions.

The estimates for each of the 6 sectors and the total economy are based upon methods that are, more or less, specific for each sector. A detailed description of these methods can be found in section D of this inventory. However, with respect to the compilation of the annual sector accounts roughly three methods can be described that differ with respect to the information available.

The main method used in ASA is the direct estimation. The direct method is used for the corporations in the market production, household sector (partly), government and NPISHs. Statistics Lithuania is traditionally collecting a lot of indicators, which are sufficient for the evaluation of economic processes directly.

In the second case a sector is only partially covered by direct sources. As a consequence to a larger extent grossing up will be necessary and more assumptions have to be made to realize the desired level of transaction details. At the moment the rest of the world sector might be an example of such a case: balance of payments data are used as primary source, but these data often are adjusted. This applies to the transactions D31 subsidies on products, D39 subsidies on production, D44 other investment income, D7 other current transfers and capital transfers D9.

In the third case no direct source information is available. Indirect methods are used for the calculations in absence of direct sources, i.e. on the part of households sector, on the non-observed economy, illegal activities, etc.

There is a long practice established in Lithuanian national accounts (LNA) dealing with the non-observed economy (NOE) issue. The approach proposed by Eurostat for classification of NOE types are applied in national accounts compilation. The possible deficiencies in the sources used for compilation of LNA were identified, and the methods how to eliminate them have been established. The system of exhaustiveness adjustments (from N1 - to N7) is created and applied to components of GDP at the detailed level. Among the possible adjustments the adjustment for misreporting (N6) is considered as most significant in LNA. The adjustment for under-over-reporting of GDP
components is made using the correction coefficients established on the basis of the survey of State Tax Inspectorate auditors.

When the Production account components are estimated the exhaustiveness adjustments are made to the gross output and intermediate consumption. Adjustments in the form of correction coefficients are incorporated in the estimates at the stage of compilation of the components at two-digit level by industry and by institutional sector. The adjustment types N2 (illegal producer), N3 (producer is not obliged to register), N6 (misreporting), and N7 (statistical deficiencies in the data) are relevant in calculation of GDP by production approach in LNA. It is worth mentioning that data for General government, Financial corporation and NPISH sectors are considered as being exhaustive, and therefore are adjusted for statistical reasons only (W&S in kind). Gross output and intermediate consumption for Nonfinancial corporations sector is adjusted due to the misreporting, though for the Household sector all above listed adjustment types are relevant and applied.

The exhaustiveness of components of Generation of income account is assured using the same typology of adjustments as for Production account. Those two sets of data are deeply related because almost the same data sources are used for their compilation in LNA. Compensation of employees is only the component that is adjusted for exhaustiveness, while the others are considered as being complete or are estimated as residual (operating surplus and mixed income). Wages and salaries (W&S) is adjusted for N6 (under-reporting) in non-financial corporation and households sectors and for N7 (W&S in kind) in all institutional sectors.

Final consumption expenditure components in the Use of disposable income account are also adjusted for the exhaustiveness, and in particular Household final consumption expenditure (HFCE). Taking into account that the variety of data sources is used for compilation of this component different approaches are applied to ensure the exhaustiveness of estimates. The attention is given to the estimates of HFCE items by the third or fourth level by COICOP, for which the respective data source is selected. The adjustments are made for under-reporting (N6), when data source from producer perspective is used, and for non-response (N7), when HBS data are applied. Adjustment for W&S in kind and tips (N7) is also made.

When the Capital account is compiled two components (GFCF and Changes in inventories) are adjusted for exhaustiveness. Taking into account the specificity of both those components and the methods to estimate them, the exhaustiveness adjustments are applied only when it is clear that data source used does not cover a particular subcomponent. For example; GFCF is adjusted for own account capital repair of dwellings made by HH (N3), Changes in inventories are grossed up by including implicitly inventories of HH as unincorporated producers, information from which is not available from the sources (N7).

Four types of illegal activity: prostitution, illegal production and smuggling of drugs and alcoholic beverages, smuggling of tobacco are estimated. Estimation all illegal activities are complex, covering also smuggling (import and export), illegal production and consumption. Illegal activities are included only in the Household sector (S.14)

All estimates of illegal activities are based on different possible data sources (including mass media) and also on several assumptions (expert’s opinion). It should be recognized that it is impossible to identify the units (their number) engaged in illegal activities. Our data sources do not allow identifying whether the illegal activity was performed by registered or not registered unit. Nevertheless, the size of illegal transaction (for instance output/and or/ import) in many cases can be estimated as the counterpart to the other one (for instance consumption).
The indirectly estimated part is changing over the years. However the main remains the same: imputed dwelling services, FISIM, agricultural output. New necessary estimations of indicators were incorporated due to all methodological requirements and to the implementation of ESA2010. The measures are taken to ensure a satisfactory transition from private accounting and administrative concepts to ESA2010 national accounting concepts. In valuation of output for own final use for market producers the estimation of mark-up for net operating surplus or mixed income is the indirect calculation. The calculation methods of mark-up are based on reliable sources, but the nature of this estimation remains indirect, i.e. imputation.

There are about 88 industries engaged in the compilation process of the Lithuania National Accounts. Statistics Lithuania publishes the national accounts figures on a more aggregated level of 64 industries on its website.

In following summary table we are presenting the estimation methods used by activities and the sectors, where the “survey-based”, “administrative” mean direct estimation, and “quantity-price”, “other” mean indirect estimation:

There are no econometric models used (for the annual compilation). Underground and four illegal activities (prostitution, illegal production and smuggling of drugs and alcoholic beverages, smuggling of tobacco) are covered to the same extent as they are covered in GDP; and there is no difference with regard to data availability between benchmark and ordinary years.
2.3 Description of compilation procedures

The regular annual sector accounts are composed in five stages.

1. Composition and processing of source data

At this stage source data are compiled, analysed and completed. The first stage includes a process, where various source data are extracted, transformed from private accounting to National accounts concepts and loaded into the national accounts working tables in a harmonised way. At this stage, the quality of the source data is monitored and corrected if needed.

2. Compilation

At this stage the source data are transformed into ESA 2010-concepts, both in terms of sectors and transactions. This part of the process is performed in the NA and GFS divisions. The compilation stage also includes all internal NA calculations and imputations, conceptual adjustments and adjustments related to insufficient coverage of source data. Conceptual adjustments are made, for instance, to output (concerning holding gains, own account production) and intermediate consumption (financial leasing, part of non-life insurance premiums and wages and salaries in kind). Estimates of underground and illegal activities as well as some imputed transactions are also added. Consumption of fixed capital is calculated in NA division for all sectors using a PIM model.

3. Horizontal balancing

Next step is to balance uses and resources for all transactions. For some transactions totals are balanced, for others a full and consistent who-to-whom-matrix is compiled. Some distributive transactions (D.421, D.41) are compiled in a sector-by-counterpart-sector matrix. This means that for each entry of these items, both the sector and the counterpart sector have to be defined. This same entry is then used in both sector’s accounts, as a resource on the one and as a use on the other. In the latter case the specialist often has to choose the most reliable option in case information of both sector and counterpart sector is available for a specific transaction in the matrix. The way the balancing process is carried out may differ per transaction. At the end of this stage uses equal resources for all transactions.

4. Vertical balancing

Two types of actions are carried out in this compilation stage. In the first place ‘the overall picture’ is considered and assessed. It may occur that some data or some developments in the data are considered as not being plausible. In such case adjustments will be made. Financial and non-financial accounts are compiled simultaneously. A second action in this compilation stage is to pay explicit attention to the statistical discrepancies. If statistical discrepancies are relatively large possibilities are considered to reduce them. If the correction of some transactions is well justified then adjustments are made to reduce the discrepancies. However, it should be emphasized that statistical discrepancies are not reduced or eliminated if no justification can be found. Correction is done in order to reduce vertical statistical discrepancy between B9 from financial accounts and other non-financial accounts, variable – usually withdrawals from income of quasi-corporations (D422REC) is adjusted for households sector (resources).
5. Publication and data transmission

At this final compilation stage data are automatically extracted from the data set in order to fill the reporting form for Eurostat (Table 8) and national publications (see paragraph 4). A final check is carried out before the tables are transmitted and published.

3. ASA consistency with related data sets

3.1. Integration of financial and non-financial ASA accounts

The vertical balance between financial and non-financial accounts is monitored during compilation rounds but full integration is not sought. Financial and non-financial accounts are compiled separately - usually using different data sources and methods. The discrepancy is used as a quality indicator. When significant discrepancies are observed, financial and non-financial transactions will be inspected in more detail – especially those where data availability and quality is weak – and in some cases, where this seems justifiable, adjustments might be made.

3.2 ASA consistency with non-financial QSA data

- ASA is a sum of QSA
- \( \times \) QSA is benchmarked on ASA
- Other case (please explain below)

Annual sector accounts are compiled in September and transmitted to the Eurostat. At this point of time the preliminary ASA for year T-1, the revisions for T-2 and for T-3 became available, i.e. data for T-2 and T-3 are revised in order to be consistent with GDP, GFS, and BoP (partly) and preliminary SUT. ASA for T04 are also revised taking into account the latest revisions to EDP, GNI and final SUT. Data set of QSA is also revised at that time, so 16 quarters for those years are benchmarked with the annual data. QSA data set for the current year T can be revised with the every quarterly transmission. However it should be noted that when the major revision of NA takes place or there is a request from Eurostat for the revision of GFS data due to the EDP issues the longer ASA time series can be affected.

3.3. ASA consistency with other data sets

3.3.1. Consistency with main aggregates (Table 1 of ESA2010 TP);

Datasets are consistent.

3.3.2. Consistency with main aggregates general government (Table 2 of ESA2010 TP)

Datasets are consistent.

3.3.3. Consistency with BoP data

The balance of payments is the most important source for the rest of the world account. However, there is no one-to-one-relationship between balance of payments and the rest of the world account (RoW).
At present the RoW account is consistent with the BoP to a large extent; except for the following transactions: Taxes on Production and import (D2), Subsidies (D3), Other current Transfers (D7), Other investment income (D44), capital transfers (D9).

4. Release policy

Each year a full set of annual sector accounts is compiled at t+9 months. The data that is required by Regulation (EU) No 549/2013 of the European Parliament and the council, Annex B (Transmission programme of data)– Table 8 is transmitted at the deadlines to Eurostat.

In NSI data are also published at t+12 months according to an approved statistical information release calendar and the Rules for the Preparation and Dissemination of Statistical Information, approved by Order No DĮ-79 of 14 March 2007 of the Director General of Statistics Lithuania (with all amendments and modifications). Annual sector accounts data is published for the main sectors S1, S11, S12, S13, S14, S15, S2. With respect to variables data are presented for about 60 non-financial transactions.

Since 2004 a full set of annual sector accounts has been published on the internet site of Statistics Lithuania–Official Statistics Portal and the yearly publications "National Accounts of Lithuania".

5. Revision policy

As indicated earlier the data for the annual sector accounts is compiled for the first time at t+9 months (preliminary annual estimates). Afterwards the annual data may be revised on several occasions.

Revisions in ASA are closely linked to revisions of annual main NA aggregates. As mentioned above, ASA will be provided once a year, where the reference year will be calculated and the previous three years will be revised. Therefore routine revisions occur yearly and comprise three years.

Once in every 5-8 years a large major revision takes place. The purpose of major revisions is to have a comprehensive view on the development of the national economy by improving estimation methods and meeting the requirements of the European System of National and Regional Accounts (ESA) and European legislation. On this occasion new sources and methods may be introduced and mistakes will be corrected. As a consequence new levels for the full annual data set of National Accounts will be compiled for a large number of years.

The main reasons for the large major revision are as follows:

1) Changes in methodology: changes in estimation methods of certain indicators, general change of methodology (e.g. transition from ESA95 to ESA 2010);
2) Emergence of new data sources;
3) Improvement of estimation methods;
4) Correction of technical errors.

In September 2014, Statistics Lithuania published data of national accounts of Lithuania revised according to Regulation (EU) No 549/2013 of the European Parliament and of the Council of 21 May 2013 on the European system of national and regional accounts in the European Union. It means that statistical indicators of national accounts recalculated according to the updated ESA 2010 methodological provisions, as well as new methods and data sources. National accounts are compiled according to the internationally harmonized methodology and data provision requirements which are the same across the EU.

6. Future plans

The first stage of the ASA revision according to the updated ESA 2010 methodological provisions was finished in 2014 and covered time series for 2004–2014. In 2017, the revision will be expanded for the years 1995–2003. Also, there are plans concerning analysis of the discrepancies between non-financial and financial annual accounts. This analysis is foreseen aiming to reduce discrepancies till the acceptable level.

B Sector delineation

1. List of the (sub) sectors

The following table describes, which sector classification is used in Lithuanian National Accounts

<table>
<thead>

</tbody>
</table>
S.11 – Non-financial corporations sector consists of institutional units which are independent legal entities and market producers, and whose principal activity is production of goods and non-financial services. In S.11 following subsectors are distinguished: S.11001-public, S.11002-national private, S.11003-foreign-controlled.

The bulk of GDP and GVA are produced in the non-financial corporations sector S.11; 69.5 per cent of Gross Value Added.

S.12 – Financial corporations sector consists of institutional units which are independent legal entities and market producers (except central bank), and whose principal activity is the production of financial services. Following subsectors are in S.12 sector of financial corporations:

S.121 – Central bank; S.122 - deposit-taking corporations except the Central bank; S.123 – money market funds (MMF); S.124 – non-MMF investment funds; S.125 – other financial intermediaries, except insurance corporations and pension funds; S.126 – financial auxiliaries; S.127 – captive financial institutions and money lenders; S.128 – insurance corporations; S.129 – pension funds. GDP by production does not reflect those subsectors directly. The sum of subsectors S.121, S.122, S.123, S.124, S.125 and S.127 is represented in appropriate activity 64 – Financial service activities, except insurance and pension funding of NACE Rev.2. Subsectors S.128 and S.129 are shown in the activity 65 – Insurance, reinsurance and pension funding, except compulsory social security. Activities 66 – Activities auxiliary to financial services and insurance activities and 94 – Activities of membership organisations compile subsector S.126.

The part of financial sector is comparably small in Lithuanian GDP. Value added of financial sector amounted 2.8 per cent of Gross Value Added in 2010 year.

S.13 – General government sector consists of institutional units which are non-market producers whose output is intended for individual and collective consumption, and are financed by compulsory payments made by units belonging to other sectors, and institutional units principally engaged in the redistribution of national income and wealth General government sector covers:

S.1311 – Central government; S.1313 – local government; S.1314 – social security funds subsectors. In GDP by production method first two subsectors are available for different functions of government (education, health, culture, sports, defence and etc.) and are presented in appropriate activities: 72-Scientific research and development, 84.1-84.2-Administration of the State and the economic and social policy of the community, 85-Education, 86-Human health activities, 87-88-Social work activities, 90-Creative, arts and entertainment activities, 91-Libraries, archives, museums and other cultural activities, 93-Sports activities and amusement and recreational activities, and etc. The subsector S.1314 is reflected in activity 84.3 – Compulsory social security.

Sector S.13 is one of the biggest in Lithuania GDP, producing 15.4 per cent of Gross value added in 2010 year.

S.14 – Households is a sector covering households as consumers and producers, producing market goods and (or) services, or producing goods and (or) services for their own final consumption. GDP by production approach reflects the subsectors S.141-employers, S.142-own-account workers and S.143-employees and includes individual enterprises, farmers, entrepreneurs and etc. Those subsectors have different sources, and are formed finally in calculations of GDP by production approach.

The households sector covers 12.2 per cent of Gross Value Added.
S.15 – Non-profit institutions serving households sector consists of non-profit institutions which are separate legal entities, which serve households and which are private non-market producers.

Sector of non-profit institutions serving households S.15 is very small and amounts only 0.1 per cent of GVA and GDP respectively in 2010. The sector covers political parties, trade unions, religious and professional associations, recreational clubs, etc.

3. Sector allocation of institutional units

Statistics Lithuania is the responsible institution for the sector classification. Sectorisation of economic entities in Statistics Lithuania is carried out in accordance with the Description of the Order (Lith.: Ūkio subjektų priskyrimo instituciniams sektoriams ir subsektoriams tvarkos aprašas), approved on 25 February 2015 by Director General of Statistics Lithuania. The Lithuanian sector classification follows the ESA 2010 rules and Description of the Order can be found at:

Sectorisation is performed taking into account the following information about the entity: the name of the entity, legal form, activity, ownership form, founder, financing and control, market or non-market producer (in cases of private non-profit institutions and public producers, the 50 % test is used).

This information is derived from the following sources: Register of Legal Units; data from statistical surveys; data from local government institutions; other sources.

Sectorisation is performed in two stages (see Table Algorithm used for the sectorisation of economic entities in the first and second stages below).

In the first stage, the code of an institutional sector and sub-sector is assigned to all economic subjects.

In the second stage, additional information related to economic subjects is collected and the code of the institutional sector and sub-sector is revised, if necessary.

The institutional sector and sub-sector codes of economic entities are listed in the Statistical Register of Economic Entities (SREE) and updated once a year. Sub-sector codes remain unchanged throughout the year, except in cases when technical errors are detected. Such errors are corrected immediately.

In some cases, the algorithm can provide a number of possible options. Changing the classification of sectors and sub-sectors may arouse controversial issues.

Unincorporated enterprises in Lithuania include individual enterprises and different types of partnerships. In SREE all individual enterprises are recorded in sector S.14. The partnerships are allocated to sector S.15, S.14, and to S.12 and S.11 as quasi-corporations. Distinguishing of quasi-corporation is made taking into account the availability of the balance sheet and not taking the risk on the household assets in the case of bankruptcy. Small Partnerships (code 96 in the Algorithm) meet both criteria according to the low.

In problematic cases, when the algorithm provides a number of possible options, the questions on units’ sectorisation are discussed in the Inter-institutional Working Group on Sectorisation. The group is hosted by Statistics Lithuania and it includes representatives from The Bank of Lithuania, Ministry of Finance and other users of the sector classification. The group discusses problematic areas and investigates borderline cases (e.g. determining the correct sector for certain financial corporations or investigating cases related to the delineation between market and non-market units).
Well-grounded arguments of the Inter-Institutional Sectorisation Group are submitted to the Inter-Institutional Group of Experts of Macroeconomic Statistics, which considers the proposals and draw up the final conclusion.
### 4. Algorithm for sector allocation of institutional units

<td>SBS, Income tax declarations of individual enterprises, Income tax declarations of natural persons carrying out economic activity. Agriculture Statistics Division data, Lithuanian Institute of Agrarian Economics - Farm Accountancy Data Network (FADN) survey.</td>
<td>Source data used directly. The indirect method “price x area” is applied for the output of actual rent calculation. The price for rental in private sector in year 2010 is extrapolated from the price for unfurnished dwellings in a base year 2000 (based on information received from Real Estate agencies) by using the Consumer Price Index for rentals in private sector. For agriculture output the “quantity x price” formula was used. The information on production of each agricultural product (quantity), average producers (“gate”) prices of each product and supply balance sheets of the most products. Cost indexes for the evaluation of input are submitted also. Adjustment was made for holding gains/losses. Corrections for exhaustiveness (N2, N3, N6, N7) were made.</td>

Annexes

Annex 1: R&D compilation

The assessment of R&D is a very multiple process, thus the distinction between institutional sectors, economic activities and types of output exists. Therefore, R&D output is classified according to its purpose: market R&D output, output of R&D produced for own final use, non-market R&D output. Estimates of R&D output are produced at the 2-digit NACE level and institutional sectors.

In general, the Frascati data (BERD) and the bridge table between Frascati data and National accounts are used in order to estimate both cases: the output of market R&D (produced for sale) and the output of R&D produced for own final use.

R&D produced by specialised commercial research laboratories or institutes whose primary activity is R&D is classified to NACE activity 72, and is valued at the revenues from sales, contracts, commissions, fees. It is treated as market R&D produced by market producers and is supposed to be sold in the market. It is produced in S.11 and S.14 institutional sectors.

Other market units performing R&D as their secondary activity are classified to any industry based upon their primary activities. Their R&D output is treated as market producers produced R&D for own final use.

In order to evaluate the R&D output of non-market producers, the alternative administrative data source provided by the Ministry of Finance is used: government final consumption expenditure distributed by function - the COFOG distribution. Information from the Frascati Manual sources is used to supplement the COFOG data when necessary.

For obvious reasons, R&D produced for own final use is capitalised within the same sector. The owning sector for non-market R&D is also directly identified. The acquisitions of market R&D are identified using the BERD survey (extramural purchasers), SBS survey data (acquisition of R&D) and Government budgetary data (expenditure for R&D). Also, the data on exports and imports of R&D are used from the Balance of Payments compiled by the Bank of Lithuania. It supplements the estimation of total R&D resources and uses.
Annex 2: FISIM compilation

FISIM is estimated on a quarterly basis, so annual FISIM estimates are equal to the sum of quarterly estimates. FISIM components are estimated for all sectors and subsectors. In addition, intermediate consumption items are distributed to user industries. The industry-distribution is based on the output of each industry.

The FISIM calculations follow the international instructions (the ESA 2010 Chapter 14, the Council Regulation 448/98 and the Commission Regulation 1889/2002). The quarterly source data used in the FISIM calculations are:

- Stocks and interest rates of deposits and loans granted by other monetary financial institutions provided by the Bank of Lithuania, (BoL).
- Stocks and accrued interest of loans and deposits with ROW provided by BoP compilers in BoL.
- Statement of loans granted from domestic creditors to Government of the Republic of Lithuania on behalf of State provided by the Ministry of Finance.
- Statement of liabilities to domestic creditors accepted by subjects attributed to State social security funds sector provided by the Ministry of Finance.

Statistics Lithuania estimates FISIM in three stages. The first one is estimation and allocation of domestic FISIM. The second - is estimation and allocation of exported and imported FISIM. The last stage is the final allocation and recording of FISIM components in the sequence of accounts. FISIM is produced by financial intermediaries (FIs): deposit-taking corporations except the central bank (S.122) and other financial intermediaries, except insurance corporations and pension funds (S.125).

Domestic FISIM is estimated and allocated to each user sector and/or subsector separately using information on stocks of deposits and loans granted by the resident FIs and corresponding accrued interest. In order to estimate domestic FISIM it is required to calculate internal reference rate (IRR) which depicts a risk- and FISIM-free interest rates between FIs.

The total FISIM by institutional sector is obtained as the sum of FISIM on loans granted to the institutional sector and FISIM on deposits of the institutional sector.

FISIM on loans granted to the institutional sector is estimated as:

\[ \text{FISIM on loans} = \text{interest receivable on loans} - \text{loan stocks} \times \text{IRR} \]

FISIM on deposits of the institutional sector is estimated as:

\[ \text{FISIM on deposits} = \text{deposit stocks} \times \text{IRR} - \text{interest payable on deposits} \]

Exports of FISIM are estimated as the sum of FISIM on loans granted by resident FIs to non-residents (excluding FIs) and FISIM on deposits of non-residents (excluding FIs) held in resident banks.
Imported FISIM is estimated for each resident institutional sector and/or subsector separately. The total FISIM imported by the institutional sector is obtained as the sum of FISIM on loans granted by non-resident FIs to the institutional sector and FISIM on deposits of the institutional sector held in non-resident FIs.

After all items have been compiled for all sectors, they can be used as separate transactions within P1, P2, P3, P62 and P72. In addition, since FISIM has to be removed from the interest flows, D.41 uses and resources are adjusted for FISIM.
Annex 3: Entertainment, literary or artistic originals

Entertainment, literary or artistic originals are evaluated on the basis of the recommendation of the Task Force and the OECD Handbook on Deriving Capital Measures of Intellectual Property Products. It comprises films; TV and radio stock programmes; literary, music and artistic originals. Because of the multiplicity of originals, they are valued using different methods.

a) The production cost approach (where the production costs are the costs of labour, capital, materials etc. including a mark-up for operating surplus for market producers) is applied to estimate the time series of GFCF for films.
Film originals are estimated on the basis of completed films. Data on the funding of film production are used in the assessment of GFCF for films. Meanwhile, the funding of film promotion and distribution is not taken into account. The mark-up for operating surplus for market producers is estimated as the share of operating surplus in total output. GFCF of films is attributed to non-financial corporations sector S11.

b) GFCF for TV and radio stock programmes (documentary, educational, music, drama, arts and history) are also evaluated by the production costs approach (including a mark-up for market producers as an operating surplus component).
The national public broadcaster National Radio and Television of Lithuania (LRT) and commercial TV broadcasters are taken into account. The estimation is based on the costs of production of LRT stock programmes and the annual broadcasting hours of LRT and commercial TV channels distinguishing different types of TV and radio programmes. An assumption is made that the production costs of a one-hour stock programme are the same for all TV channels. The mark-up for market producers is estimated as the share of operating surplus in the total output. GFCF of LRT is attributed to general government sector S13, meanwhile commercial broadcasters’ GFCF - to non-financial corporations sector S11.

c) The value of literature, music and artistic originals is measured by the net present value of royalty flows. The formula recommended by the Task Force is used: \( W_j = H_j \times (1 + r_j - i_j) \), where \( W_j \) is the present value of originals produced in the year \( j \), \( H_j \) is the sum of royalties paid in the total economy during the year \( j \), \( r_j \) is the growth rate of royalties, compared to the previous year, \( i_j \) is the interest rate used for discounting. Its GFCF is attributed to households S14 sector.
Annex 4: Acquisitions less disposals of valuables

The commodity flow method is used to evaluate the acquisitions less disposals of valuables which comprise different categories of goods, i.e. precious stones and metals, antiques, other works of arts and other valuables, such as jewellery. For the assessment, the foreign trade statistics and domestic industries statistics data are used as a basis.

Also, additional adjustments are made in order to evaluate acquisitions less disposals of valuables at purchaser’s prices and make a distinction between the valuables which are held as a store of value and consumer durables, i.e. final consumption expenditure.

Taking into account these aspects, further assessment of sectoral acquisitions less disposals of valuables is performed on the basis of the expert evaluation method.
Annex 6: Acquisitions less disposals of valuables
Annex 5: Own-account computer software.

Own-account computer software is calculated from the supply side, more specifically, from total wages and salaries in each of the economic activities which are considered to be engaged in own-account production of computer software.

Structural earnings survey information on wage and salary levels and changes by job category and the information on the number of software professionals from the ISCO-08 group 25 are used. According to international recommendations, only the half of the software workers’ worktime is spent on the production of own-account software, as there is no better estimate. Furthermore, it is assumed that the worktime spent on the production of own-account software in the economic activities 62–63 (NACE Rev. 2) is even much smaller of because these activities mostly produce the customised market software.

The total wages and salaries for market sector are grossed up using a mark-up factor. The adjusted values cover the non-labour part of the costs such as intermediate consumption and gross operating surplus for market activities as well as intermediate consumption and consumption of fixed capital for non-market activities.
Annex 6: Share of estimates per transaction/sector in section D

Here, the share of estimated values in the total (estimated +observed) amount recorded for each sector is evaluated. 'Observed amount' refers to a value calculated through the use of direct sources, including through directly observed counterpart data. 'Estimated amount' refers to a value calculated by using statistical or modelling techniques.

The table uses the following codes:
- E80: estimates dominate in the final value by more than 80%
- E50: estimates dominate in the final value between 50-80%
- OE: observed value dominate final value, though estimates were used
- OV: only observed values
